# Inspired by nature

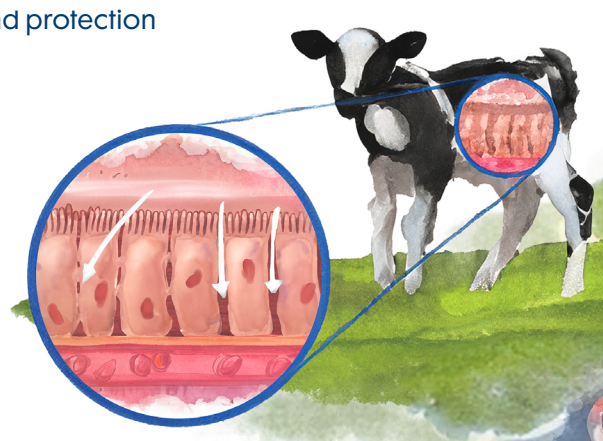

We discovered how signals found in cow's milk naturally initiate optimal calf development

> "Balancing growth and performance

**Our calf-centric approach**

- Focusing on ideal growth patterns
- Fatty acids in cow's milk act as a natural signal for rapid calf development
- Aids natural gut closure for optimal nutrient absorption and protection

**Activating the gut for growth**

- Fatty acids in cow's milk signal the closure of the intestinal lining
- Protects against pathogens and supports consistent calf health
- Fatty acids also trigger early rumen development for increased solid feed intake

**Building a natural body composition**

- Balanced fat ratio to build natural body composition
- Boosts metabolism
- Supports long-term dairy performance

> "Natural nutrient absorption grows more resilient calves

**A more sustainable solution**

- Reduced trace mineral levels resemble cow's milk for better absorption
- Fewer trace minerals excreted lead to less environmental waste
- Bioavailable minerals ensure sustainable nutrition
