BETTER FEED-FOOTPRINT DECISIONS START WITH DATA YOU CAN TRUST

Whether producing feed or using footprint information further along the supply chain, credible, traceable data supports better decisions and reporting.

As sustainability reporting expectations grow, the demand for reliable feed-footprint data is increasing across the supply chain.

- Processors and retailers need accurate, auditable feed footprint data
- Feed compounders are repeatedly asked to provide carbon footprint information in different formats
- Supply chains increasingly benefit from access to more specific data instead of using proxy values
- Manual data exchange is inefficient and time consuming
- Greater data traceability can help streamline auditing and reporting as well as avoiding duplication

The result is inefficiency, limited transparency and reduced confidence in reported emissions.

MyFeedPrint

MyFeedPrint is an environmental footprint service built on internationally recognised Life Cycle Assessment (LCA) standards that calculates the environmental footprint of feed. MyFeedPrint turns footprint data into information you can use to make informed decisions

Using recognised data, PEFCR methodology and multiple databases including GFLI, it provides consistent, traceable footprint information for decision-making and reporting across the supply chain.

1 **Input raw material data**

2 **Add feedmill energy consumption**

3 **Calculate the footprint of the finished feed**

4 **Use footprint insights to inform sourcing and reporting**

MyFeedPrint methodology and calculation tool have been independently verified by Kiwa for conformity with ISO 14040 and ISO 14044. MyFeedPrint is a recognized tool by GMP+ International for calculating the environmental footprint of feed products according to the MI5.7 Feed life cycle assessment (LCA) protocol.

MYFEEDPRINT CONNECTS DATA THROUGH THE SUPPLY CHAIN

FARMERS/ HOME MIXER

"What is the carbon footprint of my feed?"

- What is the footprint of the raw material I am purchasing?
- Can I use this footprint information with confidence?
- Can I use this data for my sustainability reporting?

FEED MILLS/ INTEGRATORS

"Can we provide a footprint customers can use?"

- Generate customer-specific results
- Calculate feed footprints using an up to date and verified methodology
- Maintain ownership and visibility of the data

PROCESSORS/ RETAILER

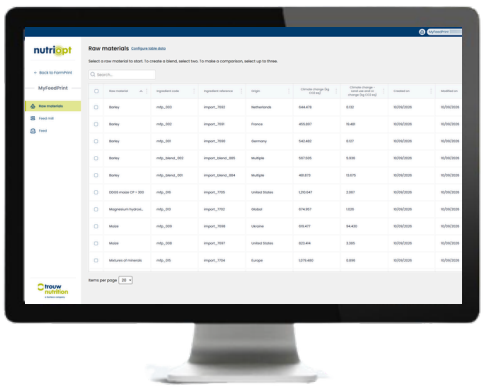

"We need better information from our supply chain"

- Accurate Scope 3 emissions data
- Reduced audit burden on farmer and feed industry
- Assurance that methodologies are robust

TRACEABLE FOOTPRINT INFORMATION THROUGH THE VALUE CHAIN

Get the full picture on your environmental footprint

More than a footprint calculator, MyFeedPrint provides an auditable number for reporting purposes and creates the digital infrastructure that allows sustainability data to move through the value chain with transparency, consistency and confidence.
